01 A Halloumi Boxes

- https://codeforces.com/problemset/problem/1903/A
- brute force, greedy, sortings, *800
- Analysis
    - n boxes/array a1 a2 ... an
    - a = {a0, a1, a2 ... an-1}
    - subarray = subsegment = segment taken out of array not manipulated ,no change in order
        - eg: {a0, a1}, {a1,a2,a3}, etc
    - He wants to sort them in non-decreasing order based on their number

- non-decreasing = increasing
- s is atmost k , means : s<=k
- however, his machine works in a strange way. It can only reverse any subarray of boxes with length `at most k`
- subarrsize<=k
- Find if it's possible to sort the boxes using any number of reverses.
- So, if K>=2 ,Machine's sort is 100%possible at `any number of reverses ANY_TIMES`
  - if k=2 atleast => i have power to shift any element anywhere
- eg:
  - 6421
    - 6421 rev 2 nos sub array my initial thought
    - 6412 rev 2 nos sub array
    - 6142 rev 2 nos sub array
    - 1642 rev 2 nos sub array
    - 1624 rev 2 nos sub array
    - 1264 rev 2 nos sub array
    - 1246 rev 2 nos sub array
    - sorting done :0
  - 6421
    - 1246 rev 4 nos sub array optimal from tuts
- atq : according to question
- tl per test = 1sec atq
  - 1sec = 10^8 Operations = per test operations
  - 1 <=k <= n (minitests)<= 100 acc.to ques (atq)
  - consider n=100 upperbound
  - tl per mini test = 1sec /100
  - per mini test operations = 10^8 / 100 = 10^6
  - if tc per mini test = $O(n^3)$
    - so n=100, then operation = $O(n^3)$ = $O(100^6)$ = per mini test operations
    - so $O(n^3)$ is the upper bound
    - even sol. can have $O(n^2)$, $O(n)$, $O(n\log n)$ etc. anything below $O(n^3)$, but not above $O(n^3)$
  - Expected TC = $O(n^3)$
- ml per test = 256mB atq
- at k=1, no sorting is possible
  - because the foundation of reverse is actually swap any atleast 2 stuff
  - if stuff is only one then it wont make sense to reverse as we lost power to shift any element
- Approach
  - Passing Condition where return YES
    - K>=2
    - or given array is already sorted
  - else, return False

```cpp
#include<bits/stdc++.h>
using namespace std;
```

```cpp
int main(){
    // at extreme proof case use :
    // long long t;
    int t;
    cin>>t;
    while(t--){
        int n,k;
        cin>>n>>k;
        vector<int> v(n);
        int i=0;
        //input
        while(i<n){
            cin>>v[i]; // n order
            i++;
        }
        vector<int> v2=v; // copy // n order
        sort(v2.begin(), v2.end());  // nlogn order
        if ((v2==v)or(k>=2)){ // to check whether initial array is sorted
or not // n order
            cout<<"YES\n";
        } else {
            cout<<"NO\n";
        }
    }
    return 0;
}
// tc O(nlogn) // highest order here
// at n = 100 , tc = 100log100 = 100*7 = 700
// 2^7 ~ 100
// log2(n) = ln n / ln 2
// sc O(n)
```

02 A Line Trip

- https://codeforces.com/problemset/problem/1901/A
- greedy, math, *800
- Analysis
  - location&road on number line
    - 0 , a1 , a2 , ... , x
    - Round Trip i.e. total path => 0, a1, ... an, x, an, ..., a1,0
    - a1,a2 ... Gas station for Tanki Full/ Refill
    - 0 start point
    - if stop at non-station location due to gas empty = gameover
    - no refuel at dest x
  - In this ques, we have to find the capacity of gas tank car should take it for journey, efficiently without stopping
  - tl per test = 2secs
    - 2secs = 2*(10^8) operations
    - t=1000 atq
    - time/testcase = O(2* 10^5)

/

- n=50 max atq
- then at O(n^3) = O(125000) = O(1.25 * 10^5) <= O(2* 10^5)
- TC for minitest = Expected TC = O(n^3) upper bound
  - tlpt = time limit per test
  - mlpt = 256mB
  - in test case 1
    - n=3
    - x=7
    - a{1,2,5}
    - 0-1-2-5-7-5-2-1-0
    - output = 4
    - gaschanges=
      - 4 start
      - 3 at 1
      - 4 refill
      - 3 at 2
      - 4 refill
      - 1 at 5
      - 4 refill
      - 2 at 7
      - NO Refill at dest x
      - 0 at 5 ,biggest gas consumption, 5->7->5 , 4 units distance
      - 4 refill
      - 1 at 2
      - 4 refill
      - 3 at 1
      - 4 refill
      - 3 end, fully reached ,gas still remaining
    - biggest gas consumption, 5->7->5 , 4 units distance
    - thus min threshold gas capacity is 4 units ,as below it , car would stop at 5->7->5
  - now the max capacity of gas tank in any journey = max distance of any 2 gas stations throughout journey
  - througout journey means a round trip
    - so, after lastGasStation, car will go to x(dest), and find lastGasStation first in return journey
    - so, that distance is (lastGasStation - x)*2
- Approach
  - C1= cal. firstGasStation-0
  - C2= max(allDistances(cal. dist b/w eachGasStation))
  - C3= cal. (lastGasStation - x)*2
  - return max(C1,C2,C3)

```
#include<bits/stdc++.h>
using namespace std;
int main(){
    long long t;
```

```cpp
    cin>>t;
    while(t--){
        long long n,x;
        cin>>n>>x;
        long long i=1;
        long long smax=0;
        vector<long long> v1(n+1,0); //initialize safety //O(n)
        v1[0]=0;
        while(i<=n){// O(n)
            cin>>v1[i];
            // cout<<v1[i];
            long long buff=smax;
            smax=max(buff,(v1[i]-v1[i-1]));
            i++;
        }
        long long smax2=(x-v1[n])*2; // O(1)
        cout<< max(smax,smax2)<<endl;
        // cout<< smax<<" "<<v1[n-1]<<" "<<smax2<<endl;

    }return 0;
}
// Time Complexity: O(n)
// Space Complexity: O(n)

//  max(a, b); O(1) // just checks (a < b)
//  min(a, b); O(1) // just checks (a < b)
// max_element(v.begin(), v.end()) O(n)
// min_element(v.begin(), v.end()) O(n)
```

- my code is more optimised than tut ;0

03 A Cover in Water

- https://codeforces.com/problemset/problem/1900/A
- constructive algorithms, greedy, implementation, strings, *800
- Analysis
    - Filip has a row of cells, some of which are blocked, and some are empty.
    - He wants all empty cells to have water in them.
    - He has two actions at his disposal
        - 1. place water in an empty cell. FINITE_TIMES
        - 2. remove water from a cell and place it in any other empty cell. ANY_TIMES
    - autoOperation
        - if at some moment cell i (2≤i≤n−1) is empty and both cells i−1 and i+1 contains water, then it becomes filled with water. ANY_TIMES
        - magic autofill
    - N => s = s1,s2,s3....,sn
        - = ...##.#....##
        - now in ...
            - if we just w.w (w=water) => www
            - then we can transfer the middle water to other cells one by one

/

- w.w sill it get refill=> www
- ...##.#....##
  - w.w##.#....## 2times fill water manual
  - www##.#....## autofill
  - w.w##.#w...## swap water
  - www##.#w...## autofill
  - w.w##w#w...## swap water
  - www##w#w...## autofill
  - w.w##w#ww..## swap water
  - www##w#ww..## autofill
  - w.w##w#www.## swap water
  - www##w#www.## autofill
  - w.w##w#wwww## swap water
  - www##w#wwww## auto fill
  - all buckets filled ;0, count=2 operation 1
  - C1: if no. of Consecutive dots(emptyBoxes) >= 3
    - then we only need 1 operation only 2TIMES as we could fill at corner of 3 boxes and middle box will autoOperationAutoFillWater and we can transfer that water to other cells `ANY_TIMES` 2 operation, and regenerate autoOperationAutoFillWater
  - C2: else we need to fill all boxes by 1 operation only as here autoOperationAutoFillWater fails
  - Expected TC
    - tlpt 1sec atq
      - mt = t max= 100 atq
      - tlpmt = 10^8 / 100 = 10^6
      - n = 100 atq
      - TCpmt = $O(n^3)$ upperbound
        - as $O(100^3) = O(10^6)$ = order of tlpmt
    - mlpt 256mB atq
- Approach
  - count no. of dots(emptyBoxes)
  - count no. of Consecutive dots(emptyBoxes)
  - if no. of Consecutive dots(emptyBoxes) >= 3
    - return 2
  - else
    - return no. of dots(emptyBoxes)
- AnotherApproach
  - if i have 3 contineous empty cell, answer is 2 else ,answer is count of all empty cells
  - similar
  - ... => (i-1), (i), (i+1)
    - just fill i-1, i+1
  - if `(s[i]=="." && i+1<n && s[i+1]=="." && i+2<n && s[i+2]=="."`
    - return 2
  - else
    - return no. of dots(emptyBoxes)

```cpp
#include<bits/stdc++.h>
using namespace std;
int main(){
    long long t;
    cin>>t;
    while (t--)
    {

        long long n;
        cin>>n;

        string s;
        cin>>s;

        int sum=0;
        int i=0;
        int dot=0;

        while(i<s.size()){
            if (s[i]=='.'& sum!=3)
            {
                sum++;
                dot++;
            }
            else if (s[i]=='#' & sum!=3)
            {
                sum=0;
            }
            i++;
        }

        if (sum>=3)
        {
            cout<<2<<endl;
        }
        else
        {
            cout<<dot<<endl;
        }

    }
    return 0;

}
// TC O(n)
// SC O(n)
```

04 A Game with Integers

- https://codeforces.com/problemset/problem/1899/A

/

- games, math, number theory, *800
- Analysis
  - Vanya and Vova are playing a game. Players are given an integer n. On their turn, the player can add 1 to the current integer or subtract 1
  - Operations any ne
    - n=n-1
    - n=n+1
  - The players take turns; Vanya starts. If after Vanya's move the integer is divisible by 3, then he wins. If 10 moves have passed and Vanya has not won, then Vova wins.
  - if both players play optimally
    - then in each of player turn he/she will try move to make other one lose
  - eg: if nos is 5
    - nos = 5
    - 6 (vanya n++) OR 4 (vanya n--)
    - 5 (vova n--) or 7 (vova n++) OR 3 (vova n--) or 5 (vova n++)
    - 6 (vanya n++) OR 4 (vanya n--) or 6 (vanya n--) OR 8 (vanya n++) or 2 (vanya n--) OR 4 (vanya n++) or 4 (vanya n--) OR 6 (vanya n++)
    - basically she will counter , to remake it even, repetitive till 10
    - she won
  - Expected TC ?
    - tlpt = 1sec atq
    - mlpt = 256mB atq
    - t = 100 atq
    - n = 1000 atq
    - 1sec = 10^8 ops
    - tlpmt = 10^8 / t = 10^8 / 100 = 10^6
    - Expected TC = O(n^2)
      - not O(n^3)
        - as 1000^3 = 10^9 < tlpmt
      - as putting n in mt O(n^2)
      - = 1000^2
      - = 10^6
      - = tlpmt
  - NOW , if both play most optimal, then they will reverse each other operations and exhause the turns
    - eg: n=6 => 7 (vanya n++) => 6 (vova n--) => infinite loop
    - n%3 == 0
      - if True, divisible before vanya move
        - even vanya could +1/ -1
        - it will not be divisible by 3
        - & vova will cancel the effect -1/ +1 of vanya till 10rounds
        - ultimate vova win
      - if False, not divisible before vanya move
        - vanya could +1/ -1
        - it will be divisible by 3 after vanya move
        - & vova will do something

/

- & vova will cancel the effect -1/ +1 of vova
                - and still it will be divisible by 3 after vanya move till 10rounds
                - ultimate vanya win
        - numbers
            - 0 DIV
            - 1 (-1=0)
            - 2 (+1=3)
            - 3 DIV
            - 4 (-1)
            - 5 (+1)
            - 6 DIV
            - 7
            - 8
            - 9 DIV
        - Eg: 6
            - => 7 => 8 => 9 => .... vanya win
            - => 7 => 6 => 7 => 6 ... vova win if played optimaly
  - Approach
    - if n%3 == 0
        - vova win, return Second
    - else if n%3 != 0
        - vanya win, return Second

```cpp
#include<bits/stdc++.h>
using namespace std;
int main(){
    long long t=0;
    cin>>t;
    while(t--){
        long long n=0;
        cin>>n;
        if (n%3==0){cout<<"Second\n";}
        else{cout<<"First\n";}
    }
    return 0;
}
// TC O(1)
// SC O(1)
```

05 A Jagged Swaps

- https://codeforces.com/problemset/problem/1896/A
- sortings, *800
- Analysis
    - here, permutation is an array
        - of unique elements
        - if array of n integers, then integet exists of all 1,..to.,n

- => ORDER DOES NOT MATTER
  - we want to check if we could sort the permutation with special operation `ANY_TIMES`
  - special operation
    - if `a[i-1] < a[i] > a[i+1]`
      - then swap a[i], a[i+1]
  - eg: 1 3 2 5 4
    - target: 1 2 3 4 5
    - now
      - 1 3 2 5 4
      - 1<3>2 5 4 satisfies spec ops
      - 1 2 3 5 4 swap :0
      - 1 2 3<5>4 satisfies spec ops
      - 1 2 3 4 5 swap :0
      - = target
  - Expected TC
    - tlpt 1sec atq
      - t max 5000 atq
      - n max 10 atq
      - 1 sec = 10^8 ops
      - tlpmt = 10^8 / 5* 10^3
        - = 10^5/ 5
        - = 2* 10^4 ops
      - O(10^4)< tlpmt
      - O(n^4) = Expected TC = tcpmt
    - mlpt 256mB atq
- Approach Optimised
  - IF THE FIRST NUMBER IN THE INITIAL ARRAY IS 1, THEN ANSWER IS YES , ELSE ANSWER IS NO
  - if not 1st element is 1 ,then that element can never shift towards its desired side
  - this is technically bubble sort
  - as if a number is largest, then it would be `a[i-1] < a[i] > a[i+1]` obviously
  - our input arrays are already a permutation perfect, so no need to crosscheck

```cpp
#include<bits/stdc++.h>
using namespace std;

int main(){

    long long t;
    cin>>t;
    while(t--){
        int n;
        cin>>n;
        vector<int> arr(n,0);
        for (int i=0; i<n; i++) cin>>arr[i];
        if (arr[0]==1) cout<<"YES\n";
        else cout<<"NO\n";

    }
```

```
      return 0;
}
// TC O(n)
// SC O(n)
```

- Approach Brute Force
  - if this is permution
    - if permutation is already sorted
      - return "YES"
    - else
      - try sort by special operation n times
      - if sorted
        - return "YES"
      - else
        - return "NO"
  - else
    - return "NO"
    - TTYL

```cpp
#include<bits/stdc++.h>
using namespace std;

string checkSort(vector<int> arr,vector<int> arr2, int n){
    for ( int faltu=0; faltu<n; faltu++){
    for ( int idx=0; idx<n; idx++){
        if (
            arr[idx]<arr[idx+1] &&
            arr[idx+1]>arr[idx+2] &&
            idx+2<n
        ){
            int temp= arr[idx+1];
            arr[idx+1]= arr[idx+2];
            arr[idx+2]=temp;

        }
    }
    if(arr2==arr) { return "YES"; }
}
    return "NO";
}

// NO NEED
string checkPert(int n){
    vector<int> arr(n);
    for (int i=0; i<n; i++) cin>>arr[i];

    vector<int> arr2=arr;
    sort(arr2.begin(),arr2.end());
```

```
    for ( int idx=0; idx<n; idx++){if (arr2[idx]!=idx+1) {return "NO";}}
    if(arr2==arr) { return "YES"; } // already sorted
    return checkSort(arr,arr2, n);// we dont feed data types as arguements
}

int main(){

    long long t;
    cin>>t;
    while(t--){
        int n;
        cin>>n;
        cout<<checkPert(n)<<"\n";

    }

    return 0;
}
```

06 A Doremy's Paint 3

- https://codeforces.com/problemset/problem/1890/A
- constructive algorithms, *800
- Analysis
    - array a = { a1,a2,a3...an}
    - n sized array
    - you want equality among the adjacent sums
    - array is good for this ques as
    - there exists a k such that a1+a2=a2+a3=...=an−1+an=k
    - Can you reorder the elements such that the condition becomes true ???
    - permute its element = change its order
    - eg : {1,1,2}
        - 1,2,1 permute done
        - now 1+2 = 2+1 = 3 :0 Done
        - "YES"
    - Expected TC?
        - tlpt = 1sec atq
        - = 10^8 ops
        - t max=100 = mt atq
        - tlmt = 10^8 / 100 = 10^6
        - n = 100
        - O(n^3) = 100^3 = 10^6 = tlmt
        - Expected TC = O(n^3)
        - mlpt = 256mB atq
        - if Expected TC = O(n^3) ,then
            - O(n^4) NO ABOVE UPPER BOUND

- O(n^3) YES UPPER BOUND
- O(n^2) YES BELOW UPPER BOUND
- O(n) YES BELOW UPPER BOUND
- O(nlog2(n)) YES BELOW UPPER BOUND
- O(n1) YES BELOW UPPER BOUND
- this helps in thinking solution limits and optimisation
- solution can be minimal, not exact O(n^3)
- but still we got to know our limits
- Approach Optimised
  - => Generalise the condition
    - a1 + a2 = a2 + a3 = ... = an-1 = an atq
    - => ai-1 + ai = ai + ai+1
    - => ai-1 + ai(cancelled) = ai(cancelled) + ai+1
    - => `ai-1 = ai+1` !!!
    - i.e. a1=a3=a4=a5=.... && a2=a4=a6=....
  - odd index positions should have same nos && even index positions should have same nos
  - NO when i have more than or equal to 3 distinct integers in my array, eg: 1 1 2 3 => no, you cant create any fair ordering
    - => Case of 3 Distinct Integers
  - ELSE NOW if we have N1 & N2, freq. f1, f2
    - we want either of both cases in n=6
      - { N1 N2 N1 N2 N1 N2 }
      - { N2 N1 N2 N1 N2 N1 }
      - => f1=f2 AT ODD N
      - YES

}

// TC O(nlog2n) = O(100*log2(100)) = O(100*7) = O(700)
// SC O(n+n)= O(2n) = O(200)

// this problem is imp to teach map,begin,rbegin iterators
```

- this problem is imp to teach map,begin,rbegin iterators

```cpp
// freq map
map<long long, long long> freq_map;
for (long long i =0; i<n; i++){//n
freq_map[a[i]]++;//logn
}
```

```cpp
if (freq_map.size()>=3) cout<<"No"<<endl;
```

```
// begin- first element
// rbegin- last element

long long freq1 = freq_map.begin()->second;
long long freq2 = freq_map.rbegin()->second;
```

- Approach Brute force
    - Similar thinking but not organised enough at first try out of clue
    - Read number of test cases t
    - For each test case:
        - Read array size x
        - Read x elements into array v1
        - Make a copy v2 and sort it
        - Make a copy v3 from v2 and remove duplicates from v3
        - If v3.size() > 2, return "NO"
        - If all elements are equal, return "YES"
        - If array size is even:
            - If frequency of smallest and largest elements is equal, return "YES"
        - If array size is odd:
            - If the frequency difference between smallest and largest elements is exactly 1, return "YES"
        - If array size is 2, return "YES"
        - Else, return "NO"

```cpp
#include<bits/stdc++.h>
using namespace std;
string goodAPCheck(int x){
    vector<int> v1(x);
    for ( int i=0; i<x; i++) cin>>v1[i];
    vector<int> v2=v1;
    sort(v2.begin(),v2.end());

    vector<int> v3=v2;
    // remove duplicates
    v3.erase(unique(v3.begin(),v3.end()),v3.end());
    if (v3.size()>2 ) return "NO";

    if (count(v1.begin(), v1.end(),v2[0])==x) return "YES";
    if (x%2==0 && count(v1.begin(), v1.end(),v2[0])==count(v1.begin(),
v1.end(),v2[x-1])) return "YES";
    if(x%2!=0 && (count(v1.begin(), v1.end(),v2[0])==count(v1.begin(),
v1.end(),v2[x-1])+1 ||count(v1.begin(),
v1.end(),v2[0])+1==count(v1.begin(), v1.end(),v2[x-1])  )) return "YES";
    if(x==2) return "YES";
    else return "NO";
```

```
}
int main(){

    long long t;
    cin>>t;
    while(t--) {
        int x = 0;
        cin>>x;
        cout<<goodAPCheck(x)<<"\n";
    }
    return 0;
}
```

07 A Don't Try to Count

- https://codeforces.com/problemset/problem/1881/A
- brute force, strings, *800
- Analysis
  - string x, len n
  - string s, len m
  - n*m <=25
    - 1, 25
    - 5, 5
    - 25, 1
  - operation ANY_TIMES
    - if x= "abc"
    - x= x+x "abcabc"
  - Find
    - min. no of operation by which
    - s is substring of x
  - Expected TC?
    - tlpt 2sec atq
      - t 10^4 max atq
      - 1sec = 2*10^8 ops per test
      - ops/minitests = 2*10^8 / 10^4 = 2*10^4 ops = 20000 ops = 25*10^2 ops
      - n*m 25 max atq
      - O(n*m*10^2) Upper bound Expected TC
    - mlpt 256mB atq
- Approach Brute Force Tuts
  - where do i finally say ,this is the end ?
    - x-> x+x -> x+x + x+x -> ... -> not infinity but a upperbound
    - arguement = upper bound is 5
    - should not go beyond 5
    - n-> x, m-> s
    - worst, n=1, m=25
    - eg : x='a', s='aa...25times...a'

- x.size()< s.size(), till this condition is true, you can never find s within x
- a => aa => aaaa => a.8..a => a..16..a => a..32..a
- 1=> 2=> 4=> 8 => 16 => 32(its enough ,more than 25 to become super set), these changes done within 5 operation
- if not done in even 5 operations then ,at 6, x=a...64..a
- if couldnt find str in 25 ,then you can't find in 64 or more ... .answer is impossible => -1

```cpp
#include<bits/stdc++.h>
using namespace std;
bool check(string s,string x)
{
    if (x.size()<s.size()) return false;
    for (int i=0; i<x.size()- s.size()+1; i++) if (x.substr(i,s.size())==s)
return true; //x.substr(i,s.size())==s substring extract
    return false;
}// O((n-m+1)*m)=O(n*m)
int main(){
    int t;
    cin>>t;
    while (t--){
        long long n,m;
        cin>>n>>m;
        string x,s;
        cin>>x>>s;

        string x0 = x;
        string x1 = x0+x0;
        string x2 = x1+x1;
        string x3 = x2+x2;
        string x4 = x3+x3;
        string x5 = x4+x4;

        long long ans = -1;
        if(check(s,x0)) ans=0;
        else if (check(s,x1)) ans=1;
        else if (check(s,x2)) ans=2;
        else if (check(s,x3)) ans=3;
        else if (check(s,x4)) ans=4;
        else if (check(s,x5)) ans=5;
        cout<<ans<<endl;

    }return 0;
}
//187 ms    100 KB
// TC O(2^5 *n*m) = O(32*n*m)
// SC O(2^5*n) = O(32*n)
```

- Approach Optimised Mine

- SAME
- input t testcases
- each test cases
  - input n,m
  - Wrong, as babb,bbb ,its not -1
    - check if x is substring of s+s
      - if no
        - then x ,even mul by infinite can't be superset or in any combination of s
        - and we took s+s as maybe x="mara", s="rama"
        - return -1
      - if yes
        - then its posible
- counter=0
- while counter<=5
  - concatnate till s is substring of x
    - counter++
- return counter
- why counter =5 ??
  - counter=m*n
  - NO, Memory limit exceeded on test 2 1734 ms 262100 KB

```cpp
#include<bits/stdc++.h>
using namespace std;
int checkCount(string x,string s){
    int counter = 0;

    while (counter<=5){
        if ((x).find(s) != string::npos){
            return counter;
        }
        counter++;
        x=x+x;

    }
    return -1;

};

int main(){
    long long t;
    cin >> t;
    while(t--){
        int n=0, m=0;
        string x="",s="";
        cin>>n>>m>>x>>s;

        // if ((s+s).find(x) == string::npos){
```

```cpp
        //     cout<<-1<<"\n";
        // }
        // else{
            cout<<checkCount(x,s)<<"\n";
        // }

    }

    return 0;
}

// passed 58 tests containing test cases :)
// 109 ms    100 KB
// Time Complexity: O(n * m)
// Space Complexity: O(n + m) (worst case 32n + m).
```

08 A How Much Does Daytona Cost?

- https://codeforces.com/problemset/problem/1878/A

    - Expected TC?
        - tlpt 1sec atq
        - mlpt 256mB atq
        - t max 1000 atq
        - n max 100 atq
        - 1 sec = 10^8 ops
        - tlpmt = 10^8 / 1000 = 10^5
        - O(100^3) = 10^6 NO
        - O(100^2) = 10^4 YES
        - Expected TC = tcpmt = O(n^2)
- Approach Optimised

- IF k is present in array anywhere, then answer is YES, else no
- a = { a0,a1,a2,k,a4...an}
- we haven't told lenght of subarray
- we can take length =1 , {k} is correct too , now in this subarray, k is the highest occurance as k is only

```cpp
#include<bits/stdc++.h>
using namespace std;
int main(){
    int t;cin>>t;while(t--){long long n,k;cin>>n>>k;
    long long a[n];for (int i=0; i<n; i++) cin>>a[i];
    long long number_is_present =0;
    for (int i=0; i<n; i++){if (a[i]==k) {number_is_present=1;break;}}
    if(number_is_present) cout<<"YES"<<endl;
    else cout<<"NO"<<endl;}return 0;
}
// TC O(n)
// SC O(n)
```

- Approach Brute Force
    - SAME nearly
    - One sec,
        - if number exists
            - if array size is 2 or 1
            - or if anywhere a[i]=a[i+1]=k
            - or if its>2
                - if in array bw that 1st occur and last occur ,that number the most occur
    - return yes if any satisfy, else no :0
    - FREAKING, the the limits, loopholes are hidden
    - functions returns>if else with breaks
    - if number exists
        - then its largest at subarray len = 1

```cpp
// template miniTests int1 int2 vectorArrayInt1
#include<bits/stdc++.h>
using namespace std;
string mainGame(int x1, int x2, vector<int> v1){
    // code here
    // x1 n
    // x2 k
    // v1 a
    for ( int i =0; i<x1; i++ ){
        if (x2==v1[i]) {return "YES";}
    }
    return "NO";

}
```

```cpp
void eachMiniTest(){
    int x1=0, x2=0;// factor1 factor2
        cin>>x1>>x2;
    vector<int> v1(x1);

    for (int i=0; i<x1; i++ ) cin>>v1[i];
    cout<< mainGame(x1,x2,v1)<<"\n";

}

int main(){

    cin>>t;
    while(t--){
        miniTest();
    }
    return 0;
}
```

TipsCollectedFromExperiences

- when check TC& SC of program, don't consider TestCasesLoop&Spaces in counting

- 1sec = 10^8 Operations

- if 1sec = totalTests

    - operationsPerTestCase = 10^8 / totalTestCases
    - if totalTestCases = 100
        - operationsPerTestCase = 10^6 operations
        - O(n^3) is UpperLimit of the question's code
            - as O(n^3) = O(100^3) = 10^6 === operationsPerTestCase

- always think of extra testcases

- if Expected TC = O(n^3) ,then

    - O(n^4) NO ABOVE UPPER BOUND
    - O(n^3) YES UPPER BOUND
    - O(n^2) YES BELOW UPPER BOUND
    - O(n) YES BELOW UPPER BOUND
    - O(nlog2(n)) YES BELOW UPPER BOUND
    - O(n1) YES BELOW UPPER BOUND
    - this helps in thinking solution limits and optimisation
    - solution can be minimal, not exact O(n^3)
    - but still we got to know our limits

- and in cp submission , you can see testcases in ID :0

- FREAKING, the the limits, loopholes are hidden

- functions returns>if else with breaks

- => Generalise the condition in question 6R800

    - a1 + a2 = a2 + a3 = ... = an-1 = an atq
    - => ai-1 + ai = ai + ai+1
    - => ai-1 + ai(cancelled) = ai(cancelled) + ai+1
    - => ai-1 = ai+1 !!!
    - i.e. a1=a3=a4=a5=.... && a2=a4=a6=....

- put this at 1st line of main() code, to fix bug of compiler at running test cases, not interactive program

```
ios::sync_with_stdio(0);
cin.tie(0);
```

- templates

```cpp
// template miniTests int1 int2 vectorArrayInt1
#include<bits/stdc++.h>
using namespace std;
void mainGame(int x1, int x2, vector<int> v1){
    // code here

}

void eachMiniTest(){
    int x1=0, x2=0;// factor1 factor2
    vector<int> v1;
    cin>>x1>>x2;
    for (int i=0; i<x1; i++ ) cin>>v1[i];
    mainGame(x1,x2,v1);

}

int main(){
    ios::sync_with_stdio(0);
    cin.tie(0);
    long long t; //mini test cases
    cin>>t;
    while(t--){
        eachMiniTest();
    }

    return 0;
}
```

```cpp
// template miniTests int1 int2 string
#include<bits/stdc++.h>
using namespace std;
void mainGame(int x1, int x2, string s){
    // code here

}

void eachMiniTest(){
    int x1=0, x2=0;// factor1 factor2
    string s;
    cin>>x1>>x2>>s;
    mainGame(x1,x2,s);

}

int main(){
    ios::sync_with_stdio(0);
    cin.tie(0);
    long long t; //mini test cases
    cin>>t;
    while(t--){
        eachMiniTest();
    }

    return 0;
}
```

- Vectors CPP STL

```cpp
vector<int> v1(n); // create ,with n elements mandatory
cin>>v1[0]; // insert
vector<int> v2 = v1; // copy
sort(v2.begin(),v2.end()); // sorting in stl, asc
bool compare= (v1==v2); // compare
```

```cpp
#include<vector>
#include<iostream>
#include<algorithm>
```

- use `long long` instead of `int` for bigger stuff

- max/min : `max(var1 ,var2)`, `min(var1, var2)`

  - make sure var1,var2 has SAME DATATYPE
  - inbuilt

/

- subarray = sub segment =segment taken out of array not manipulated ,no change in order

    - eg of a = {a0, a1, a2 ... an-1}, subarrs : {a0, a1}, {a1,a2,a3}, etc

- non-decreasing = increasing

- s is atmost k , means : s<=k

- atq : according to question

- How to Calculate Expected TC? eg: in 1R800

    - tl per test = 1sec atq
        - 1sec = 10^8 Operations = per test operations
        - 1 <=k <= n (minitests)<= 100 acc.to ques (atq)
        - consider n=100 upperbound
        - tl per mini test = 1sec /100
        - per mini test operations = 10^8 / 100 = 10^6
        - if tc per mini test = O(n^3)
            - so n=100, then operation = O(n^3) = O(100^6) = per mini test operations
            - so O(n^3) is the upper bound
            - even sol. can have O(n^2), O(n), O(nlogn) etc. anything below O(n^3), but not above O(n^3)
        - Expected TC = O(n^3)

-
```
// 1R800
// at extreme proof case use :
long long t;
```

-
```
// 1R800
// at n = 100 , tc = 100log100 = 100*7 = 700
// 2^7 ~ 100
// log2(n) = ln n / ln 2
```

-
```
// 1R800
// input, n order
cin>>v[i]; // n order

// vector copy, n order
vector<int> v2=v; // copy // n order

// sort stl func, n order
sort(v2.begin(), v2.end());  // nlogn order

// vector compare, n order
if (v2==v) // vector compare // n order
```

- tlpt = time limit per test

- 2secs = 2*(10^8) operations

- at 2R800 , tl per test = 2secs

    - 2secs = 2*(10^8) operations
    - t=1000 atq
    - time/testcase = O(2* 10^5)
    - n=50 max atq
    - then at O(n^3) = O(125000) = O(1.25 * 10^5) <= O(2* 10^5)
    - TC for minitest = Expected TC = O(n^3) upper bound

-
    ```
    //  max(a, b); O(1) // just checks (a < b)
    //  min(a, b); O(1) // just checks (a < b)
    // max_element(v.begin(), v.end()) O(n)
    // min_element(v.begin(), v.end()) O(n)
    ```

- `vector<long long> v1(10,0);` initialize safety vector

- : What the Fish Ques

- Parity

    - Parity is simply whether a number is even or odd.
    - Even parity: divisible by 2 (like 2, 4, 6, 8...)
    - Odd parity: not divisible by 2 (like 1, 3, 5, 7...)

- 6R800 this problem is imp to teach map,begin,rbegin iterators

```
// freq map
map<long long, long long> freq_map;
for (long long i =0; i<n; i++){//n
freq_map[a[i]]++;//logn
}
```

```
if (freq_map.size()>=3) cout<<"No"<<endl;
```

```
// begin- first element
// rbegin- last element

long long freq1 = freq_map.begin()->second;
long long freq2 = freq_map.rbegin()->second;
```

Array Coloring [ONSIGHT]

- https://codeforces.com/problemset/problem/1857/A
- greedy, math, *800
- Analysis
  - given Array, n integers
  - to do
    - if you can
      - colour array elements in 2 groups/ 2 colors
      - parity of color 1 elements sum = parity of color 2 elements sum
      - print YES
    - else print NO
  - Parity
    - Parity is simply whether a number is even or odd.
    - Even parity: divisible by 2 (like 2, 4, 6, 8...)
    - Odd parity: not divisible by 2 (like 1, 3, 5, 7...)
  - eg: [1,2,4,3,2,3,5,4]
    - c1: [1,2,3] , c1 sum = even parity
    - c2: [4,2,3,5,4], c2 sum = odd parity
    - YES
  - eg: [4,7]
    - NO
  - eg: [3,9,8]
    - YES
    - c1: [3,9]
    - c2: [8]
    - both sum even parity
  - eg: [1,7]
    - YES
    - c1: [1]
    - c2: [7]
    - both sum odd parity
  - eg: [5,4,3,2,1]
    - NO
    - can't make 2color groups with same parity
- Approach
  - if no. of odds = no. of evens
    - YES
  - else if n=3 && no. of odds != 3 or !=1
    - YES
    - actually if [even,even,even] works YES
    - [odd,odd,odd] NO
    - [odd,odd,even] YES
    - [odd,even,even] NO

/

- so iff n is odd && odd< even && abs(odd-even)!=1
  - YES
  - [odd,odd,odd,even,even] NO
  - [odd,odd,even,even,even] YES
  - [odd,odd,odd,even,even,even,even] NO

```cpp
#include<bits/stdc++.h>
using namespace std;

int main(){
    ios::sync_with_stdio(0);
    cin.tie(0);
    int t;
    cin>> t;
    while (t--)
    {
        int n,odd=0,even=0;
        cin>>n;
        vector<int> v1(n,0);
        for (int i=0; i<n; i++){
            cin>>v1[i];
            if (v1[i]%2==0) {even++;}
            else {odd++;}
        }
        // cout<<odd<<" "<< even<<endl;
        if (odd==even && n>2) {
            cout<<"YES\n";
        }
        else if ((n==2 && odd!=even) || (n==3 && odd>even) || (n%2!=0 &&
odd<even && abs(odd-even)!=1) || even==1 || odd==1)
        {
            cout<<"YES\n";
        }
        else
        {
            cout<<"NO\n";
        }

    }

    return 0;
}
```
